

Operation Guide :

1. Scan the QR code to download the APP "CloudKey" to your iPhone or iPad.
2. Plug in the hardware cloudkey and open that installed APP.
3. Create a master password for APP log in, this master password will be stored in the hardware cloudkey for lifetime(can be changed later in settings), should never be forget. If you forget your master password, you can not restore Cloudkey on your own. We can reformat Cloudkey at a cost, and you can use your Cloudkey again.
4. There's an IE bar on top of the APP, type in desired website address starting with [http://.....](http://), and press "search" on iPhone, it will link you to the address. When you type in your ID & PW to get in your account, the APP will ask you for whether to save or cancel, press save, and then whole link with ID/PW will be save automatically into your account list. Next time when you want to check in same account, no need to type the address again, just one touch to that link and you'll be linked inside your account directly.
5. Now you can start to add/edit accounts, change master password, BackUp account from Export or Import from, and delete backup account(delete single account is very simple, just hold the list line and left slipping like you usually operate on iPhone). max. to 20 sets account list can be saved.
6. Additionally there's a + on top of the account list site, is to keep all your ID/PW under security protected, a safe place for your own memo.
7. Every time when you back to main page of the APP the log in password needs to be verified for security purpose.
